

Turing Machines

$$\delta : Q \times \Sigma \rightarrow Q \times \begin{matrix} \text{Left} \\ \text{or Right} \end{matrix} \times \Sigma$$

initial tape = input w/ infinite \sqcup before & after
 \uparrow
 blank

$\Sigma = \{0, 1\}$ = input

" Σ " = $\{0, 1, \sqcup, \hat{0}, \hat{1}, \text{EOF}, \text{true}, \text{false}\}$ = tape alphabet

Two special states = ACCEPT and REJECT

\hookrightarrow TMs may never stop "halt"

\hookrightarrow loops or diverges

$$\delta(q_1, c) = (q_2, d, L)$$

TM $t = (Q, \Sigma, \Gamma, q_0, \delta, q_a, q_r)$
 \downarrow finite set \downarrow alphabet \downarrow alphabet
 $\sqcup \in \Gamma$ and $\sqcup \notin \Sigma$

$$\delta : (Q - \{q_a, q_r\}) \times \Gamma \rightarrow Q \times \Gamma \times \{L, R\}$$

$$\Sigma \subseteq \Gamma$$

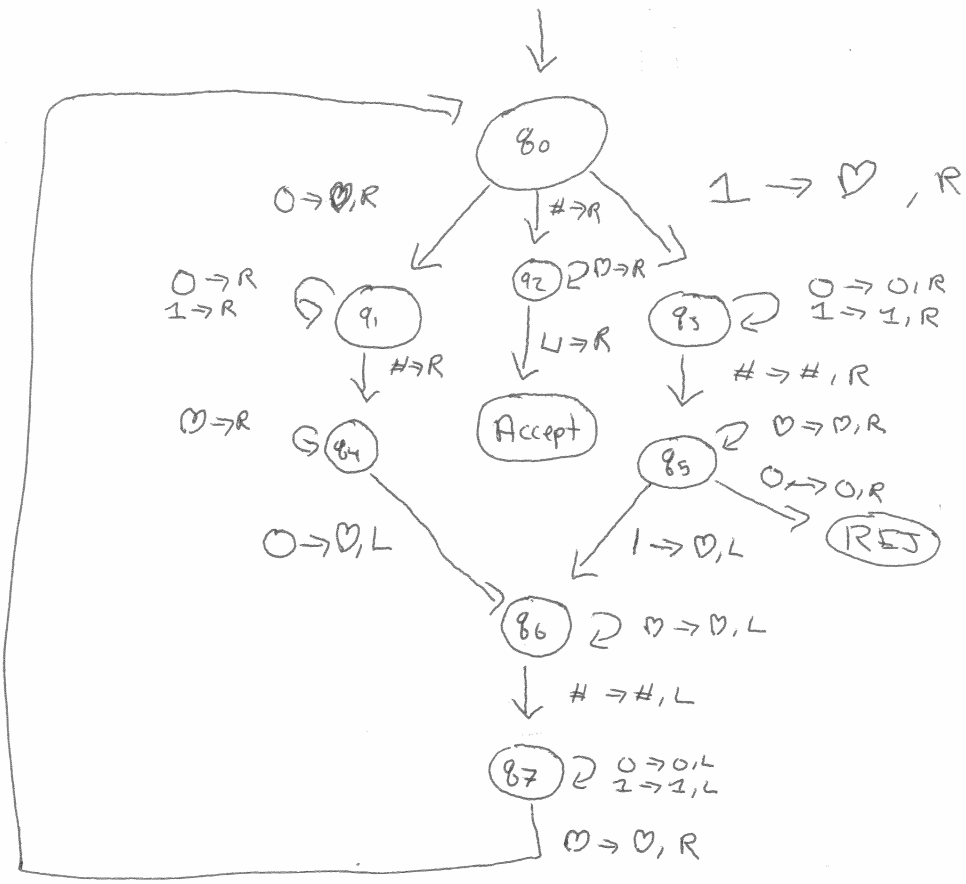

17-2)

$\{ w \# w \mid w \in \{0,1\}^* \}$

$\Sigma = \{0,1,\#\}$

$\Gamma = \{0,1,\#, \sqcup, \heartsuit\}$

$C \rightarrow R$
 \equiv
 $C \rightarrow C, R$

chan A tape [infinite]

int pos = 0; int q = q0;

while (q != qa & q != qr) {

 switch (q) {

 case q0:

reads the tape

 switch (tape[pos]) {

 case \sqcup: q = qr; break;

writes the tape

 case 0: q = q1; tape[pos] = \heartsuit; pos++; break;

 case 1: " q3 " " "

pos++ => right

pos-- => left

7-3/

A run of T.M. T is a sequence of configuration

A config is a state, a head position, and a tape written as

$$w [q_i] v$$

the state is q_i

the tape is $w \dots w v w \dots$

head pos is between w and v (ie on v_0)

The initial config of T.M. T on input w is

$$\epsilon [q_0] w$$

Run $w \# w$ machine on $01 \# 01$
(checked 1st char)
