I felt that I learned a lot about algorithms from this class. The structure of the class took a while to get used to, but I thought it was very effective. I did think it was hard to do the homework assignments in the 2 hours time period.

You made an intense CS class thoroughly enjoyable! It was a little quick, but the pace was manageable. Your teaching technique is awesome! Please consider staying at Vassar! ~~of~~ There is a lot ^{that} kids here can learn from you.

I learned a LOT in this class. It was hard at first, but gave me the skills to digest very dense textbooks by myself. Thank you!

The best computer science course I've taken,
Your enthusiasm enriches lectures. Your dedication (office hours, fast
grading, code, videos, etc.) is incredible. Very grateful to have
had you as a professor. Really appreciate it - thanks Jay.

I found the class a little too fast at times, but it wasn't a big deal. I appreciated the breadth-first approach.

The course was good. I think you might
need to focus more on how the class is
and less on how you want it to be. However
I think the class improved greatly over
the course of the semester. I also hated
the text book.

1) I believe you when you say you don't want us to spend more than 2 hrs, but it goes against everything that's been drilled into us, so I can't leave exercises unanswered, and I need the points.

2) Your teaching style I'm sure works for some, but does not help me with the way I learn things.

Otherwise, interesting course, thank-you.

I really like your teaching philosophy, that is diligence & correctness. I think this is more conducive to learning difficult material than the alternative. However, I do not think that reading the text book before learning about the topic was very successful. This caused me more frustration than the alternative either way. I think you did a great job of teaching a difficult class.

The class was extremely difficult, but also very rewarding. The class structure was unique, and I still can't tell if I like it or not. I liked the office hours and how available you were, so that was nice. I found office hours more useful than class when I found the topic difficult.

I had been dreading having to take this class, and it easily could have been the worse class of my academic career, but your grading methods (especially partial credit), were a lifesaver. I felt like I could learn without freaking out about grades, so thank you. You might not be interested in teaching intro comp sci classes, but the presentation you gave at the hackathon was really good!

I really enjoyed the "backward teaching" this course used. This forced me to attempt to learn the material before class and then you reinforced the main ideas of each section during class time. I feel like I have a pretty solid knowledge about the big ideas of each section and I can definitely use that to delve deeper in later classes into certain algorithms.

Jay, you're awesome in a lot of ways, and this course was super interesting. I felt like the book was incredibly dense, and at the end, I'm not sure how well the formatting was in the end. With extra support, things ended up okay, though the text at times made things far more dense than necessary. I really enjoyed hearing about your projects though! super cool!

I really liked the way you did this course. It kept me engaged and was 100000%. Better than the ~~usual~~ CS professors who stand in front and just read off the screen. I also like that you focused on the big picture. I think that will help me actually remember stuff in the long run rather than a bunch of little stuff I'll forget before Christmas. Have a great break and thanks!

This class starts out as extremely intimidating and it consistently seems as though what we are being asked to do is impossibly difficult, but once I started doing the work each time I realized that it was possible and your expectations were not as high as they initially seemed (a good thing). I don't feel like I know a lot of algorithms, but I think I thoroughly understand the concept of algorithms. I think that is what you were going for.

Subject matter was really interesting. Definitely found the textbook challenging and a little bit dense, but overall I liked the course. I definitely feel that I've gained knowledge about the subject matter but my abilities are not quite good enough yet. Thanks for the occasional help, it was cool to see you program in class.

As slow as I was in understanding most, if not all subjects of the class, I find ~~was~~ I enjoyed the class, even if it was utter hell at times. I believe a great strength of the course was your open schedule to meet with students. It's an area some professors are lacking in. I enjoyed the free form of the experiment assignment, but ~~that~~ I believe an example of what I was trying to achieve. (maybe a quick overview of ^a previous student's work). Thanks for a great class. I ~~do~~ don't want to keep Aaron

i'm not sure i'm ready to commit to more than one 10 on a survey.

I think there is a difference between the time it takes to read a chapter, and the time it takes to internalize the content of the chapter. Furthermore, though 8 is a relatively small number of exercises, most of the exercises had multiple parts to them, which makes that number deceiving.

i also don't love toast that much definitely understood more after class but I am nervous that there are things that I don't know I don't understand.

I find that the book doesn't give a lot of explanation on how it concludes certain things, and also it never shows us examples of how to write a proof a certain way (especially for ch. 3...) so I am often caught confused, frustrated, and feeling lost

You don't like toast? :(

I don't know who Libby is. But I'll assume you love them a lot. Also, toast is great. So my answer for the last is confused.

I'm warming up to the way the class is structured. It was kind of difficult to do this problem set without having gone on anything. I do wish that you would provide slightly more in-depth comments on problem sets (or perhaps we could get them if we were to try them again?). In any case, your energy in the classroom is really helpful and awesome! Much love!

I am confused by the scale on the last question. I feel neutrally about toast and I do not know Libby.

i feel like it would have taken more than five hours to do the exercises, since I did not understand a lot of the material, but since that wasn't an option, I had to pick you're crazy.

Feel free to put any anonymous comments here

Even if they aren't graded for correctness, I would appreciate a question by question this-is-right this-is-wrong. Sometimes I'm not confident whether or not my answer was wrong or right if we don't go over the corresponding question in class. I know this is more work for you and I don't want to burden you, especially because I appreciate the quick turnaround on homework grading.

Can we not read about things but DO things, like on a computer???!!!! It's called COMPUTER science for a reason (it's really applied math, I know, but APPLIED nonetheless).

I feel like grading homework for correctness would terrify me even more, as often I don't have any idea whether I'm doing things correctly and can't see the 'big' picture until class. It's hard to stop at only 2hrs, when you WANT to understand things and finish everything, but you don't really understand anything and your brain turns to mush.

I feel that the textbook does too good a job condensing its ideas. It's too dense, for me at least. That has been the only gripe for this class. I think that the conventional method would be more effective because all of us would be able to have a deeper understanding of the material (from your lecture) to allow us to truly grasp and appreciate what the exercises try to show us.

I feel bad that I don't get all of the questions done, but it is really nice to sit down and focus for two hours and then be done with it for the night.

I feel like it would be helpful to maybe have comments on the assignment questions we don't cover in class, just to make sure that we do get an idea of how far off we were from the answer to the question. But as I'm usually wrong the first time I hand it in, having it

graded for correctness would stress me out.

I'm not sure how I feel about the class order, but I will think I understand the big picture and then try to do an exercise and get completely hung up/confused and it takes me a really long time. I'm worried about what the tests will look like

Please give feedback on the assignment and in particular how to improve the second time through it.

More definitive instructions or more examples. What took me a while was figuring out what to test and what I wanted my experiment to be. That was my main difficulty. It would also aid in giving me more of an idea of what you're looking for from the project.

I thought that the assignment was quite fun and felt like I learned a good deal from it.

I don't think there's anything that I can really think of in trying to improve this the second time through. It would be kinda nice to have some sort of template or something to look at as far as seeing what might be good for the report, but I feel that the assignment was a good addition to the exercises that we are doing in the book. It would also be nice to have the due date not be a date when we have exercises to be turned in, but that's not really as much of an issue.

More guidelines would be welcome!

It was good.

I thought it was very helpful. The coding took longer than expected, but plotting the run times and seeing them match up with their asymptotic run times was pretty cool.

I liked that the project allowed us the freedom to select whatever topic we wanted to do. I think being a little more clear on the expectations of the project might be helpful.

I thought it was a really nice assignment and I liked its openness. I don't know how to improve it.

I'm going to assume the assignment mentioned is assignment 8. I thought that the assignment was the same as usual.

The only confusing part of the assignment was that initially I didn't know what the expectation was, although now I feel like I have a better understanding.

I really liked the freedom that I had to choose my own thesis and shape my own experiment. I think it would be cool to do presentations (short, 5 min) about what we did and our results, so we can see what other students did and their findings.

I'm still not sure what you expect as part of the analysis.

It was difficult but not confusing. I feel much more prepared for the second one based on my experience with the first one so I hope that it doesn't change too much. I feel like I can go into the second assignment with better ideas of what I'm trying to do and how long it will take to do it.

The assignment was interesting! I think everyone will be a bit more comfortable with it the second time around because we know what you are looking for.

I felt that the assignment was okay.

I'm not really sure. I think it's pretty straightforward.

Did you feel prepared for the midterm BEFORE seeing it?

Please give me any comments about the midterm

I felt that the questions on the midterm were very fair. However I did not feel like we had enough time to do the number of questions required.

I feel like not all the questions were about material we covered in class/what we read in the book, but that maybe have been the phrasing of the questions, or the fact that I did

not feel we had enough time to think about the questions and answers, for the 'necessary' questions (read the ones that added up to 0.7), let alone the other ones.

The midterm was much too long to finish in the allotted time. To even have a chance at getting full credit, we would need to do the 7 questions (1 from each chapter: $7 * .1 = .7$) and 6 more (an extra 1 from all but one of the chapters: $6 * .05 = .3$). Given the multi-part nature of each of the midterm problems, answering all of the questions thoroughly with only 75 minutes is extremely difficult.

It was really nice to be able to choose which questions you wanted to answer from a range of questions, some involving more theoretical stuff and actual proofs with others kinda looking at the overarching idea of that part of the textbook. This was nice as it gave more options for ways in which you could possibly answer, and made the test more overall fair.

I don't think anyone knew we were supposed to bring our own paper.

I felt that there were too many questions to do in order to get a good grade.

I felt that I needed to write a lot in order to fully answer each question. As a result, I did not do that many.

I wasn't prepared for the quantity of questions. Each question took me a while to answer. I wanted to at least attempt, to some degree, each question, but before I knew it time was running out and I had yet to answer at least one question in each section. It was overwhelming.

I thought it was definitely very lengthy for the time given. I felt like I could have answered enough questions to get 100%, but only with more time.

I have to say that this midterm was probably the most fair one I have ever taken in a theory class. I loved how there were multiple questions for each chapter so we could keep to our strengths. There were a wide variety of questions to choose from, and they really were "Do you understand this concept" (Just like you said! I'm sorry I doubted you...). I did feel rushed because I wanted to go more in depth on some questions, but there were a lot of chapters to cover; I would have liked more time.

It was too long for the amount of time allotted.

I felt like there were too many questions. So much so that my approach to the exam fell apart, because I was constantly trying to answer each question but I couldn't focus on any particular one and get my answer perfect. I also felt like some of your questions were vague in terms of what you expected/wanted from our answers, in terms of both depth and length. Because of this, I had a really hard time defining any one thing really well.

I am worried because I spent a lot of time answering each question I attempted as deeply and carefully as possible, and as a result I did not get to very many. Talking to some of my classmates (albeit not very many) it sounds like other people may have quickly answered as many questions as possible. I'm worried that one of these methods may be favored over the other when it comes to grading but I'm not sure.

There were a few too many questions for the amount of time we had to complete it. If we

had 30 more minutes it would have been perfect.

I think that the midterm made me realize that the approach I have been taking to the class so far might not be in line with your objectives--I was mostly focused on the details (e.g. solving problems), and treated the big picture as something to merely keep in mind. I think that this did not prepare me well for the midterm as I don't feel as though I cultivated enough awareness of what I am doing when I try to work through problems--I simply try to do them. Nevertheless, I quite liked the kinds of questions that were asked on the midterm and the way it was formatted, even if the approach I had taken to the subject material wasn't suited to them. I just wasn't expecting it to be the way it was and will revise my approach to the class.

The questions themselves were fair. I couldn't come close to finishing all of them though, even though I felt like I knew most of them. It seemed to test how fast I could write, more so than if I knew the material.

How could I better prepare you for the final than I did for the midterm?

Maybe you could give us a practice final, to help us prepare. I came into this test having no idea what to expect.

Not that I can think of.

After having seen the midterm, I felt really prepared. Beforehand though, I was terrified as to what the midterm would include and stressed about how much depth I needed to go into for studying.

I don't know.

I really like the videos that you did for the last couple of chapters (I rewatched those twice) so I would love for those to keep happening. Is the final cumulative or one the rest of the chapters we will cover? I also think presentations on our next assignment might help convey the big picture/study for final but I don't know what other students did for their project.

I don't think that there's that much more things you could have done to prepare us for the midterm... but saying that there was nothing online that could really help us was kind of terrifying. You adequately prepared us for the midterm I believe

I felt very prepared after I saw the questions on the exam. But some kind of review session before the exam might be helpful.

I was not aware that there would be such a time crunch to finish. These questions required much more writing than many of the textbook exercises. Writing full sentences to construct arguments does take more time.

Perhaps having more questions phrased the same way? Otherwise, I think we should be able to adapt what we get from the class to the final exam, now that we know what it'll be like. But definitely need to give more time.

An in class review session maybe?

I think going a little slower in class might be better for me as many concepts don't sink in for me immediately.

Clearer discussion of big ideas and concepts. I know that for me, I struggle with discerning them on my own and they aren't always made explicitly clear in class.

Now that I've seen the midterm I feel much more prepared for the final.

I think as far as the material on the questions, it was very fair.

I really enjoy your video previews, they clarify the text immensely. I also enjoy going through the exercises together, because I feel like you demystify any details I struggle with.

A few practice questions would be a great addition to the resources available to us.

Does two hours of studying per class prepare you adequately to discuss the section and understand the discussion?

Feel free to put any anonymous comments here

The rolls were delicious, thank you very much!

I definitely feel more confident of the fact that you want us to get the big picture after the midterm exam... I guess there's just always a feeling of uncertainty since hearing that a test is about "the big picture" as this can vary greatly from what students consider to be the big picture.

I really enjoy the format of the class right now, but I'm concerned about participation points since we have evolved from presenting exercise questions; is it possible to fulfill those by going to office hours, being attentive, and asking questions? This is my biggest concern for the course right now.

The midterm was too long!

I love your breadrolls. In fact I would love them toasted. I love toast.

I feel that the videos are incredibly helpful for learning each section. Without them, I would have spent forever trying to understand how quick sort and counting sort worked.

The rolls were really delicious.
